Partha Pratim
Das

Week Recap

Objectives &
Outline

Example of a
Relation

Attributes

Schema and
Instance

Keys

Relational Query
Languages

Module Summary

Database Management Systems

Module 06: Introduction to Relational Model/1

Partha Pratim Das

Department of Computer Science and Engineering
Indian Institute of Technology, Kharagpur

ppd@cse.iitkgp.ac.in

Module 06

Partha Pratim
Das

Week Recap

Objectives &
Outline

Example of a
Relation

Attributes

Schema and
Instance

Keys

Relational Query
Languages

Module Summary

- The proliferation of DBMS in wide range of applications provide motivation to study the subject
- Know Your Course provided information about prerequisites, outline and text book
- The specific need for a DBMS discussed in contrast to a file system based application using a programming language like Python
- Basic notions of a DBMS are introduced

Module 06

Partha Pratim
Das

Week Recap

Objectives &
Outline

Example of a
Relation

Attributes

Schema and
Instance

Keys

Relational Query
Languages

Module Summary

- To understand attributes and their types
- To understand the mathematical structure of relational model
 - Schema
 - Instance
 - Keys
- To familiarize with different types of relational query languages

Module 06

Partha Pratim
Das

Objectives &
Outline

Example of a
Relation

Attributes

Schema and
Instance

Keys

Relational Query
Languages

Module Summary

- Consider
Students = Roll#, First Name, Last Name, DoB, Passport#, Aadhaar#, Department
relation
- The set of allowed values for each attribute is called the **domain** of the attribute
 - **Roll #**: Alphanumeric string
 - **First Name, Last Name**: Alpha String
 - **DoB**: Date
 - **Passport #**: String (Letter followed by 7 digits) – nullable (optional)
 - **Aadhaar #**: 12-digit number
 - **Department**: Alpha String
- Attribute values are (normally) required to be **atomic**; that is, indivisible
- The special value **null** is a member of every domain. Indicates that the value is **unknown**
- The null value may cause complications in the definition of many operations

Example of a
Relation

Attributes

Schema and
Instance

Keys

Relational Query
Languages

Module Summary

- For
Students = Roll#, First Name, Last Name, DoB, Passport#, Aadhaar#, Department
- And **domain** of the attributes as:
 - **Roll #**: Alphanumeric string
 - **First Name, Last Name**: Alpha String
 - **DoB**: Date
 - **Passport #**: String (Letter followed by 7 digits) – nullable (optional)
 - **Aadhaar #**: 12-digit number
 - **Department**: Alpha String

Roll #	First Name	Last Name	DoB	Passport #	Aadhaar #	Department
15CS10026	Lalit	Dubey	27-Mar-1997	L4032464	1728-6174-9239	Computer
16EE30029	Jatin	Chopra	17-Nov-1996	null	3917-1836-3816	Electrical

Week Recap

Objectives &
Outline

Example of a
Relation

Attributes

Schema and
Instance

Keys

Relational Query
Languages

Module Summary

- A_1, A_2, \dots, A_n are *attributes*
- $R = (A_1, A_2, \dots, A_n)$ is a *relation schema*
Example: *instructor* = (*ID*, *name*, *dept_name*, *salary*)
- Formally, given sets D_1, D_2, \dots, D_n a **relation** r is a subset of

$$D_1 \times D_2 \times \dots \times D_n$$

Thus, a relation is a set of n -tuples (a_1, a_2, \dots, a_n) where each $a_i \in D_i$

- The current values (**relation instance**) of a relation are specified by a table
- An element t of r is a tuple, represented by a row in a table
- Example:
 $\text{instructor} \equiv (\text{String}(5) \times \text{String} \times \text{String} \times \text{Number}^+)$, where $ID \in \text{String}(5)$,
 $\text{name} \in \text{String}$, $\text{dept_name} \in \text{String}$, and $\text{salary} \in \text{Number}^+$

Relations are Unordered with Unique Tuples

Module 06

Outline

Example of a
Relation

Attributes

Schema and
Instance

Keys

Relational Query
Languages

Module Summary

- **Order of tuples / rows is irrelevant** (tuples may be stored in an arbitrary order)
- **No two tuples / rows may be identical**
- Example: *instructor* relation with unordered tuples

<i>ID</i>	<i>name</i>	<i>dept_name</i>	<i>salary</i>
22222	Einstein	Physics	95000
12121	Wu	Finance	90000
32343	El Said	History	60000

Week Recap

Objectives &
Outline

Example of a
Relation

Attributes

Schema and
Instance

Keys

Relational Query
Languages

Module Summary

- Let $K \subseteq R$, where R is the set of attributes in the relation
- K is a **superkey** of R if values for K are sufficient to identify a unique tuple of each possible relation $r(R)$
 - Example: $\{ID\}$ and $\{ID, name\}$ are both superkeys of *instructor*
- Superkey K is a **candidate key** if K is minimal
 - Example: $\{ID\}$ is a candidate key for *instructor*
- One of the candidate keys is selected to be the **primary key**
 - Which one?
- A **surrogate key** (or synthetic key) in a database is a unique identifier for either an *entity* in the modeled world or an *object* in the database
 - The surrogate key is *not* derived from application data, unlike a *natural* (or *business*) key which is derived from application data

Module 06

Objectives &
Outline

Example of a
Relation

Attributes

Schema and
Instance

Keys

Relational Query
Languages

Module Summary

- *Students = Roll#, First Name, Last Name, DoB, Passport#, Aadhaar#, Department*
- **Super Key:** Roll #, {Roll #, DoB}
- **Candidate Keys:** Roll #, {First Name, Last Name}, Aadhaar#
 - Passport # cannot be a key. Why?
 - Null values are allowed for Passport # (a student may not have a passport)
- **Primary Key:** Roll #
 - Can Aadhaar# be a key?
 - It may suffice for unique identification. But Roll# may have additional useful information. For example: 14CS92P01
 - ▷ Read 14CS92P01 as 14-CS-92-P-01
 - ▷ 14: Admission in 2014
 - ▷ CS: Department = CS
 - ▷ 92: Category of Student
 - ▷ P: Type of admission: *Project*
 - ▷ 01: Serial Number

Module 06

Week Recap

Objectives &
OutlineExample of a
Relation

Attributes

Schema and
Instance

Keys

Relational Query
Languages

Module Summary

- **Secondary / Alternate Key:** {First Name, Last Name}, Aadhaar #
- **Simple Key:** Consists of a *single attribute*
- **Composite Key:** {First Name, Last Name}
 - Consists of more than one attribute to uniquely identify an entity occurrence
 - One or more of the attributes, which make up the key, are not simple keys in their own right

<u>Roll #</u>	First Name	Last Name	DoB	Passport #	Aadhaar #	Department
15CS10026	Lalit	Dubey	27-Mar-1997	L4032464	1728-6174-9239	Computer

OutlineExample of a
Relation

Attributes

Schema and
Instance

Keys

Relational Query
Languages

Module Summary

- **Foreign key constraint:** Value in one relation must appear in another
 - **Referencing** relation
 - ▷ Enrolment: Foreign Keys – Roll #, Course #
 - **Referenced** relation
 - ▷ Students, Courses
- A **compound key** consists of *more than one attribute* to uniquely identify an entity occurrence
 - Each attribute, which makes up the key, is a simple key in its own right
 - {Roll #, Course #}

Students

Keys

Relational Query
Languages

Module Summary

Procedural viz-a-viz Non-procedural or Declarative Paradigms

- **Procedural programming** requires that the programmer tell the computer what to do
 - That is, *how* to get the output for the range of required inputs
 - The programmer must know an appropriate algorithm
- **Declarative programming** requires a more descriptive style
 - The programmer must know *what* relationships hold between various entities

Outline

Example of a
Relation

Attributes

Schema and
Instance

Keys

Relational Query
Languages

Module Summary

Procedural vs. Non-procedural or Declarative Paradigms

- **Example: Square root of n**
 - Procedural
 - a) Guess x_0 (close to root of n)
 - b) $i \leftarrow 0$
 - c) $x_{i+1} \leftarrow (x_i + n/x_i)/2$
 - d) Repeat Step 2 if $|x_{i+1} - x_i| > \textit{delta}$
 - Declarative
 - ▷ Root of n is m such that $m^2 = n$

Schema and
Instance

Keys

Relational Query
Languages

Module Summary

- “Pure” languages:
 - Relational algebra
 - Tuple relational calculus
 - Domain relational calculus
- The above 3 pure languages are equivalent in computing power
- We will concentrate on relational algebra
 - Not Turing-machine equivalent
 - ▷ Not all algorithms can be expressed in RA
 - Consists of 6 basic operations

Module 06

Objectives &
Outline

Example of a
Relation

Attributes

Schema and
Instance

Keys

Relational Query
Languages

Module Summary

- Introduced the notion of attributes and their types
- Taken an overview of the mathematical structure of relational model – schema and instance
- Introduced the notion of keys – primary as well as foreign
