Update Table

Data
Manipulation
Language (DML):
Query Structure

Select Clause

Where Clause

From Clause

Module Summary

- IBM developed *Structured English Query Language* (**SEQUEL**) as part of System R project. Renamed Structured Query Language (SQL: *pronounced still as SEQUEL*)
- ANSI and ISO standard SQL:

SQL-86	First formalized by ANSI
SQL-89	+ Integrity Constraints
SQL-92	Major revision (ISO/IEC 9075 standard), De-facto Industry Standard
SQL:1999	+ Regular Expression Matching, Recursive Queries, Triggers, Support for Procedural and Control Flow Statements , Nonscalar types (Arrays), and Some OO features (structured types), Embedding SQL in Java (SQL/OLB) , and Embedding Java in SQL (SQL/JRT)
SQL:2003	+ XML features (SQL/XML) , Window Functions, Standardized Sequences, and Columns with Auto-generated Values (identity columns)
SQL:2006	+ Ways of importing and storing XML data in an SQL database, manipulating it within the database, and publishing both XML and conventional SQL-data in XML form
SQL:2008	Legalizes ORDER BY outside Cursor Definitions + INSTEAD OF Triggers, TRUNCATE Statement, and FETCH Clause
SQL:2011	+ Temporal Data (PERIOD FOR) Enhancements for Window Functions and FETCH Clause
SQL:2016	+ Row Pattern Matching, Polymorphic Table Functions, and JSON
SQL:2019	+ Multidimensional Arrays (MDarray type and operators)

History of Query Language (2): Compliance

Module 08

Das

Objectives &
Outline

Outline

History of SQL

Data Definition
Language (DDL)

Create Table

Integrity Constraints

Update Table

Data

Manipulation
Language (DML):
Query Structure

Select Clause

Where Clause

From Clause

Module Summary

- SQL is the de facto industry standard today for relational or structured data systems
- Commercial systems as well as open systems may be fully or partially compliant to one or more standards from SQL-92 onward
- Not all examples here may work on your particular system. Check your system's SQL documentation

History of Query Language (3): Alternatives

Module 08

Outline

Outline

History of SQL

Data Definition
Language (DDL)

Create Table

Integrity Constraints

Update Table

Data
Manipulation
Language (DML):
Query Structure

Select Clause

Where Clause

From Clause

Module Summary

- There aren't any alternatives to SQL for speaking to relational databases (that is, SQL as a protocol), but there are many alternatives to writing SQL in the applications
- These alternatives have been implemented in the form of frontends for working with relational databases. Some examples of a frontend include (for a section of languages):
 - [SchemeQL](#) and [CLSQL](#), which are probably the most flexible, owing to their Lisp heritage, but they also look like a lot more like SQL than other frontends
 - [LINQ](#) (in .Net)
 - [ScalaQL](#) and [ScalaQuery](#) (in [Scala](#))
 - [SqlStatement](#), [ActiveRecord](#) and many others in [Ruby](#)
 - [HaskellDB](#)
 - ...the list goes on for many other languages.

Create Table

Integrity Constraints

Update Table

Data

Manipulation
Language (DML):
Query Structure

Select Clause

Where Clause

From Clause

Module Summary

- There are several query languages that are derived from or inspired by SQL. Of these, the most popular and effective is SPARQL.
 - **SPARQL** (pronounced *sparkle*, a recursive acronym for *SPARQL Protocol and RDF Query Language*) is an RDF query language
 - ▷ A semantic query language for databases - able to retrieve and manipulate data stored in **Resource Description Framework** (RDF) format.
 - ▷ It has been standardized by the W3C Consortium as key technology of the semantic web
 - ▷ Versions:
 - **SPARQL 1.0** (January 2008)
 - **SPARQL 1.1** (March, 2013)
 - ▷ Used as the query languages for several NoSQL systems - particularly the Graph Databases that use RDF as store

Module 08

Create Table

Integrity Constraints

Update Table

Data

Manipulation

Language (DML):

Query Structure

Select Clause

Where Clause

From Clause

Module Summary

The SQL data-definition language (DDL) allows the specification of information about relations, including:

- The *Schema* for each *Relation*
- The *Domain* of values associated with each *Attribute*
- *Integrity Constraints*
- And, as we will see later, also other information such as
 - The set of *Indices* to be maintained for each relations
 - *Security and Authorization* information for each relation
 - The *Physical Storage Structure* of each relation on disk

Domain Types in SQL

Module 08

Partha Pratim
Das

Outline

Outline

History of SQL

Data Definition
Language (DDL)

Create Table

Integrity Constraints

Update Table

Data
Manipulation
Language (DML):
Query Structure

Select Clause

Where Clause

From Clause

Module Summary

- **char(n)**. Fixed length character string, with user-specified length n
- **varchar(n)**. Variable length character strings, with user-specified maximum length n
- **int**. Integer (a finite subset of the integers that is machine-dependent)
- **smallint(n)**. Small integer (a machine-dependent subset of the integer domain type)
- **numeric(p, d)**. Fixed point number, with user-specified precision of p digits, with d digits to the right of decimal point. (ex., **numeric**(3, 1), allows 44.5 to be stores exactly, but not 444.5 or 0.32)
- **real, double precision**. Floating point and double-precision floating point numbers, with machine-dependent precision
- **float(n)**. Floating point number, with user-specified precision of at least n digits
- More are covered in Chapter 4

Schema Diagram for University Database

Module 08

Das

Objectives &
Outline

Outline

History of SQL

Data Definition
Language (DDL)

Create Table

Integrity Constraints

Update Table

Data

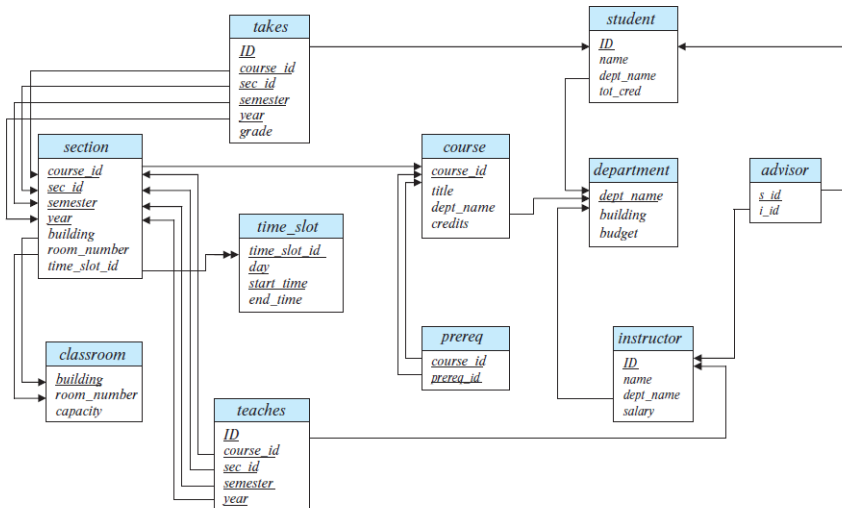

Manipulation

Language (DML):

Query Structure

Select Clause

Where Clause

From Clause

Module Summary

- An SQL relation is defined using the **create table** command:

create table r ($A_1D_1, A_2D_2, \dots, A_nD_n$),
 (*integrity-constraint*₁),
 ...
 (*integrity-constraint* _{k}));

- r is the name of the relation
- each A_i is an attribute name in the schema of relation r
- D_i is the data type of values in the domain of attribute A_i

Create Table Construct (2)

Module 08

Partha Pratim
DasObjectives &
Outline

Outline

History of SQL

Data Definition
Language (DDL)

Create Table

Integrity Constraints

Update Table

Data
Manipulation
Language (DML):
Query Structure

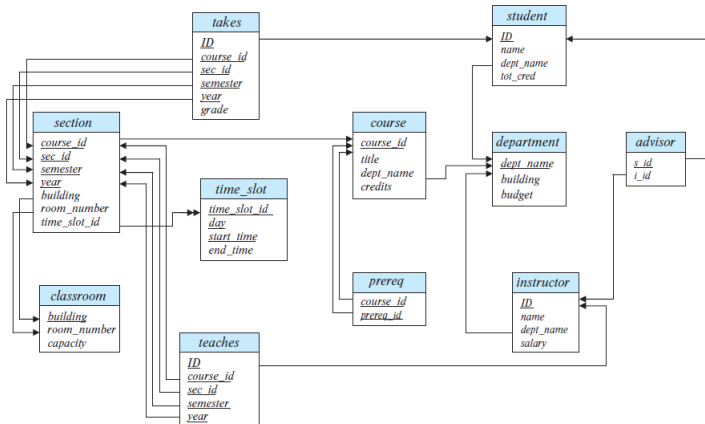

Select Clause

Where Clause

From Clause

Module Summary

```
create table instructor (
    ID char(5),
    name varchar(20)
    dept_name varchar(20)
    salary numeric(8, 2));
```

Create Table Construct (3): Integrity Constraints

Module 08

Partha Pratim

Objectives &
Outline

Outline

History of SQL

Data Definition
Language (DDL)

Create Table

Integrity Constraints

Update Table

Data
Manipulation
Language (DML):
Query Structure

Select Clause

Where Clause

From Clause

Module Summary

- **not null**
- **primary key** (A_1, \dots, A_n)
- **foreign key** (A_m, \dots, A_n) **references** r

```
create table instructor (  
    ID char(5),  
    name varchar(20)  
    dept_name varchar(20)  
    salary numeric(8,2));
```

```
create table instructor (  
    ID char(5),  
    name varchar(20) not null,  
    dept_name varchar(20),  
    salary numeric(8,2),  
    primary key (ID),  
    foreign key (dept_name) references department));
```

primary key declaration on an attribute automatically ensures **not null**

Module 08

Language (DDL)

Create Table

Integrity Constraints

Update Table

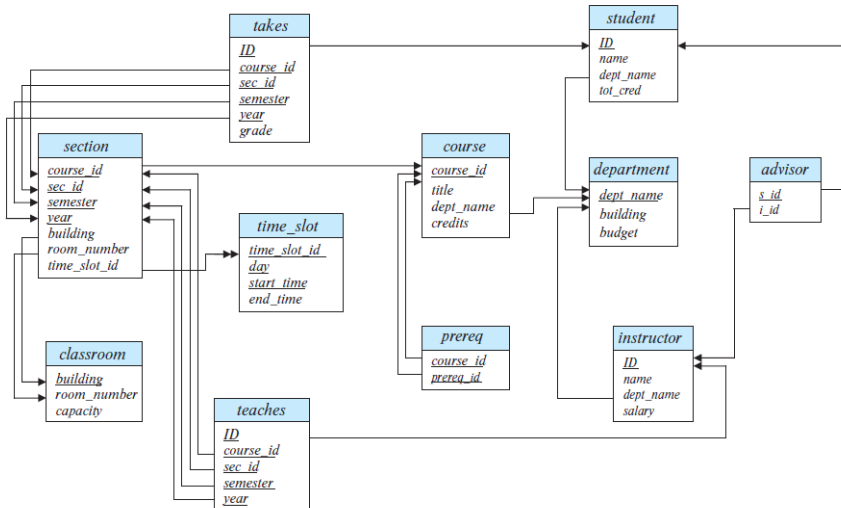

Data
Manipulation
Language (DML):
Query Structure

Select Clause

Where Clause

From Clause

Module Summary

```
create table student (  
    ID varchar(5),  
    name varchar(20) not null,  
    dept_name varchar(20),  
    tot_cred numeric(3, 0),  
    primary key (ID),  
    foreign key (dept_name)  
    references department);
```

```
create table course (  
    course_id varchar(8),  
    title varchar(50),  
    dept_name varchar(20),  
    credits numeric(2, 0),  
    primary key (course_id),  
    foreign key (dept_name)  
    references department);
```

```
create table takes (  
    ID varchar(5),  
    course_id varchar(8), sec_id varchar(8),  
    semester varchar(6), year numeric(4, 0),  
    grade varchar(2),  
    primary key (ID, course_id, sec_id, semester, year),  
    foreign key (ID) references student  
    foreign key (course_id, sec_id, semester, year)  
    references section);
```

- **Note:** *sec_id* can be dropped from primary key above, to ensure a student cannot be registered for two sections of the same course in the same semester

Update Tables

Das

Objectives &
Outline

Outline

History of SQL

Data Definition
Language (DDL)

Create Table

Integrity Constraints

Update Table

Data

Manipulation

Language (DML):

Query Structure

Select Clause

Where Clause

From Clause

Module Summary

- **Insert (DML command)**

- **insert into** *instructor* **values** ('10211', 'Smith', 'Biology', 66000);

- **Delete (DML command)**

- Remove all tuples from the *student* relation

delete from *student*

- **Drop Table (DDL command)**

- **drop table** *r*

- **Alter (DDL command)**

- **alter table** *r* **add** *A D*

- ▷ Where *A* is the name of the attribute to be added to relation *r* and *D* is the domain of *A*
- ▷ All existing tuples in the relation are assigned *null* as the value for the new attribute

- **alter table** *r* **drop** *A*

- ▷ Where *A* is the name of an attribute of relation *r*
- ▷ Dropping of attributes not supported by many databases

Outline

Outline

History of SQL

Data Definition
Language (DDL)

Create Table

Integrity Constraints

Update Table

Data
Manipulation
Language (DML):
Query Structure

Select Clause

Where Clause

From Clause

Module Summary

- A typical SQL query has the form:
select A_1, A_2, \dots, A_n ,
from r_1, r_2, \dots, r_m
where P
 - A_i represents an attribute from r_i 's
 - r_i represents a relation
 - P is a predicate
- The result of an SQL query is a relation

Select Clause

Module 08

Partha Pratim
Das

Objectives &
Outline

Outline

History of SQL

Data Definition
Language (DDL)

Create Table

Integrity Constraints

Update Table

Data
Manipulation
Language (DML):
Query Structure

Select Clause

Where Clause

From Clause

Module Summary

- The **select** clause lists the attributes desired in the result of a query
 - Corresponds to the projection operation of the relational algebra
- Example: find the names of all instructors:
select *name*,
from *instructor*
- NOTE: SQL names are case insensitive (that is, you may use upper-case or lower-case letters)
 - *Name* \equiv *NAME* \equiv *name*
 - Some people use upper case wherever we use bold font

Select Clause (2)

Module 08

Partha Pratim
Das

Objectives &
Outline

Outline

History of SQL

Data Definition
Language (DDL)

Create Table

Integrity Constraints

Update Table

Data

Manipulation
Language (DML):
Query Structure

Select Clause

Where Clause

From Clause

Module Summary

- **SQL allows duplicates in relations as well as in query results!!!**
- To force the elimination of duplicates, insert the keyword **distinct** after select
- Find the department names of all instructors, and remove duplicates
select distinct dept_name
from instructor
- The keyword **all** specifies that duplicates should not be removed
select all dept_name
from instructor

Select Clause (3)

Module 08

Partha Pratim
Das

Objectives &
Outline

Outline

History of SQL

Data Definition
Language (DDL)

Create Table

Integrity Constraints

Update Table

Data
Manipulation
Language (DML):
Query Structure

Select Clause

Where Clause

From Clause

Module Summary

- An asterisk in the select clause denotes *all attributes*
select *
from instructor
- An attribute can be a literal with no **from** clause
select '437'
 - Results is a table with one column and a single row with value '437'
 - Can give the column a name using:
select '437' as FOO
- An attribute can be a literal with **from** clause
select 'A'
from instructor
 - Result is a table with one column and N rows (number of tuples in the instructors table), each row with value 'A'

Select Clause (4)

Module 08

Partha Pratim
Das

Objectives &
Outline

Outline

History of SQL

Data Definition
Language (DDL)

Create Table

Integrity Constraints

Update Table

Data

Manipulation

Language (DML):

Query Structure

Select Clause

Where Clause

From Clause

Module Summary

The **select** clause can contain arithmetic expressions involving the operation, $+$, $-$, $*$, and $/$, and operating on constants or attributes of tuples

- The query:

```
select ID, name, salary/12  
from instructor
```

- Would return a relation that is the same as the *instructor* relation, except that the value of the attribute *salary* is divided by 12
- Can rename “*salary/12*” using the **as** clause:

```
select ID, name, salary/12 as monthly_salary
```

Where Clause

Module 08

Partha Pratim
Das

Objectives &
Outline

Outline

History of SQL

Data Definition
Language (DDL)

Create Table

Integrity Constraints

Update Table

Data

Manipulation

Language (DML):

Query Structure

Select Clause

Where Clause

From Clause

Module Summary

- The **where** clause specifies conditions that the result must satisfy
 - Corresponds to the selection predicate of the relational algebra
- To find all instructors in Comp. Sci. dept

```
select name
from instructor
where dept_name = 'Comp. Sci.'
```
- Comparison results can be combined using the logical connectives **and**, **or**, and **not**
 - To find all instructors in Comp. Sci. dept with salary > 80000

```
select name
from instructor
where dept_name = 'Comp. Sci.' and salary > 80000
```
- Comparisons can be applied to results of arithmetic expressions

From Clause

Module 08

Outline

Outline

History of SQL

Data Definition
Language (DDL)

Create Table

Integrity Constraints

Update Table

Data
Manipulation
Language (DML):
Query Structure

Select Clause

Where Clause

From Clause

Module Summary

- The **from** clause lists the relations involved in the query
 - Corresponds to the Cartesian product operation of the relational algebra
- Find the Cartesian product *instructor X teaches*
select *
from *instructor, teaches*
 - Generates every possible instructor-teaches pair, with all attributes from both relations
 - For common attributes (for example, *ID*), the attributes in the resulting table are renamed using the relation name (for example, *instructor.ID*)
- Cartesian product not very useful directly, but useful combined with where-clause condition (selection operation in relational algebra)
